TT electronics offers one of the most diverse ranges of high voltage resistors. Across the HV range from 1 to 100kV products are available which provide safety in discharge, reliability in balancing and accuracy in measurement. For designers requiring a resistor with parameters outside of this range, bespoke solutions for specific applications may be supplied.

From commercial thick-film & precision high voltage devices to bleeders, dividers and ultra high resistance values ($10^9\Omega$), products are supplied to key commercial & military standards. RoHS compliant Pb-free finish and SnPb finish are both available across most product families. Because of its ability to maintain good stability of resistivity in the presence of high voltage stress, the technology normally used for compact high voltage resistors is thick-film.

TT electronics companies have been leaders in thick-film product development since the 1960s and can now offer a full range of component styles including compact SMD chips, conventional axial throughhole and space-saving single-in-line (SIL) radial format.

This Application Note gives data, calculations and typical products for use in high voltage circuits. It should be read in conjunction with the full datasheets for each product referenced.

- EN60065 safety bleeders
- Voltage balancing resistors
- Resistive voltage dividers
- LEVs up to 100kV
- Ohmic values to $10^9\Omega$
- Compatibility with oil or SF$_6$ filled assemblies
- MIL-R-49462 approval
- X-ray PSU • AED • Electron Microscope • E-beam Welder
- Electrostatic Precipitator • Air Ioniser • Photomultiplier
- Gas Detector • Lighting Ballast • IR Tester • EL Backlight
- PFC • UPS • ESD Protection • Seismic Monitor • Paint Spray

RESISTORS FOR HIGH VOLTAGE APPLICATIONS

High Voltage Bleeders

Bleed resistors are used to discharge capacitors to safe voltage levels after power is removed. A bleed resistor may be either switched across the capacitor for rapid discharge without quiescent dissipation (Figure 1), or permanently connected for high reliability and low cost (Figure 2). In the latter case there is a tradeoff between the time to reach safe discharge and the quiescent power loss.

Selecting a maximum suitable ohmic value is achieved from an exponential discharge calculation (Figure 3):

\[ R_{\text{max}} = \frac{-T_d}{C \cdot \ln(V_t / V_o)} \]

where \( T_d \) is discharge time, \( C \) is capacitance value assuming maximum positive tolerance, \( V_t \) is safety threshold voltage and \( V_o \) is the initial voltage. The closest standard value below \( R_{\text{max}} \) should be used.

For a selected value \( R \), the initial power is given by

\[ P_o = \frac{V_o^2}{R} \]

Example 1

A high voltage rail with a maximum of 1kV has a 1μF±20% reservoir. This needs to be discharged below 50V within 10s of switch-off.

This can just be achieved with a bleed value of 2MΩ, but to allow for a 5% tolerance, 2M2 is a better choice. With this the maximum time to discharge is 8.3s and the power dissipation at full voltage is 0.45W.

A suitable solution is VRW37-2M2J, rated at 0.5W and 3.5kV.

For a switched bleeder this is the peak power. For a permanently connected bleeder it is the continuous dissipation, and the resistor chosen must be rated accordingly.

Capacitor Discharge Calculator is an on-line tool for safety-related bleed resistor selection which is available at:

In bleeder applications precision is generally unimportant and 5% tolerance can be used. However, safety is often critical, and in mains (line) connected applications a suitable safety approval such as EN60065 should be called up. This standard ensures that the component will withstand the lightning or switching induced surges found on power lines.

Example Products

**VRW37** Buy Now
- EN60065 Approved
- 3.5kV rating
- 10kV pulse rating

**CDR** Inquire
- Ratings to 30kV
- Non-contaminating, for use inside oil filled capacitors

**CGH** Buy Now
- Value range to 2kV
- Ratings 750V to 20kV
- Power to 5W
RESISTORS FOR HIGH VOLTAGE APPLICATIONS

Voltage Balancing Resistors

All aluminium electrolytic capacitors exhibit a leakage current when a DC voltage is connected across them. This may be modelled by a leakage resistance connected in parallel with the capacitor. This resistance is non-linear, that is, its value is a function of the applied voltage. Furthermore, the value is poorly defined, having a large degree of variation from one capacitor to another.

The solution is to use balancing resistors as shown in Figure 5. These are high value resistors rated at the appropriate voltage and matched in value to within a few percent. The value needs to be as high as possible to minimise power dissipation, but is generally chosen so that it is no more than 10% of the lowest value of leakage resistance at the rated voltage of the capacitor, Vr. That is, Rba ≤ Rla(Vr)/10. By this means the effect of the unbalanced internal capacitor leakage resistances is swamped by that of the balancing resistors, and the voltages are approximately equalised, so Va ≈ Vb.

In order to raise the total capacitance value, two or more pairs of capacitors may be connected in parallel. There are two configurations which may be used; either a bank of parallel connected capacitors may be balanced by a single pair of balancing resistors (Figure 6), or each pair of capacitors may be provided with its own pair of balancing resistors (Figure 7). Although clearly offering a lower component count, the first option suffers from a significantly lower reliability. This is because the effect of a short circuit failure of any one capacitor in the bank is that full bus voltage appears across the capacitors in the opposite half of the circuit. The circuit failure rate for n capacitors with a FIT of F is therefore n.F. The second option offers a superior reliability as a capacitor short failure will only cause failure of its twin. Depending on the acceptable level of degradation in smoothing, the FIT rate may therefore be <F.

Example Products

**WPYP**
- Inquire
  - Direct mount
  - Vibration resistant
  - Rating to 13W
  - High overload wirewound

**HVP**
- Inquire
  - Ratings to 20kV
  - Minimal footprint
  - Compact construction
  - High value thick-film
RESISTORS FOR HIGH VOLTAGE APPLICATIONS

Voltage Dividers

A common application for high voltage resistors is in voltage dividers for the measurement or control of high voltage rails. Figure 8 shows a typical application in which the output of a high voltage power supply is scaled down and fed back for regulation purposes. Assuming that the input impedance of the buffer is much greater than \( R_1 \) the loading on the divider is negligible, so the voltage ratio is simply given by:

\[
\frac{V_i}{V_o} = \frac{R_1 + R_2}{R_1} = 1 + \frac{R_2}{R_1}
\]

Having selected nominal values, the next consideration is the tolerance needed. The tolerance in resistance ratio is simply the sum of the individual resistance tolerances. These are not necessarily the same; often it is most economical to select a tighter tolerance on the low voltage part. For example, high voltage \( R_2 \) at 1% and low voltage \( R_1 \) at 0.1% gives a resistance ratio tolerance of 1.1%. The conversion of this to voltage ratio tolerance is shown in Figure 9, but for ratios above 50:1 they are effectively the same. Suitable precision low voltage parts are RC Series (through hole) and PCF Series (SMD chip).

It should be noted that the voltage ratio is not the same as the resistance ratio \( R_2 / R_1 \) but is offset by one. Therefore, for example, for a voltage ratio of 1000:1 it is necessary to define a resistance ratio of 999:1. For a discrete resistor design it is preferable to select standard values, and some examples for decade voltage ratios are given in Table 1.

For high precision applications the sources of error to be considered include finite loading of the divider by the buffer amplifier input, voltage coefficient of resistance (VCR) and temperature coefficient of resistance (TCR). The VCR is always negative and approximately linear over a limited voltage range and so may be compensated for to some extent. The effect of TCR, and, indeed, of tolerance, may be reduced by selecting matched sets or integrated dividers with a specified ratio tolerance and TCR tracking.

Example Products

**T**
- Buy Now
- To 50kV in air or 100kV in oil
- Power to 10W
- Matched sets available
- 25ppm/°C available
- Low VCR

**HVC**
- Buy Now
- Compact solution
- 3kV in 2512 size
- Low assembly cost

**4530**
- Inquire
- Ratings to 20kV
- Small footprint
- Integrated divider
- Ratio tolerance specified
RESISTORS FOR HIGH VOLTAGE APPLICATIONS

- **Electrostatic Precipitator**
- **X-Ray Supply**
- **T48 in Oil or SF6**
- **MV Supply Resistive Measure**
- **E-beam Welder**
- **T43/44 Precision Ultra-High Voltage**
- **Defibrillator**
- **ESD Protection**
- **Air Ioniser**
- **Photomultiplier**

- **MIL-R-49462**
- **CGH & CMH Thick Film High Voltage**
- **F43/44 Thick Film High Voltage**
- **Insulation Test**
- **Fluorescent Tube Ballast**
- **EL Backlight Inverter**
- **Radiation, Gas & Seismic Detection**
- **Electrostatic Paint Spray**
- **High Voltage Axial Resistor**
- **VRW, MH & GC High Voltage**
- **GS-3 Axial Metal Glaze**
- **3800 Ultra-High Value**
- **4500 & 4530 Thick Film Planar Resistor / Divider**
- **HVP Compact Thick Film Planar Resistor**
- **LHVC & HVC High Voltage Chip Resistor**
- **RESISTORS FOR HIGH VOLTAGE APPLICATIONS**
- **Electrical Resistor**
- **MV Supply Resistive Measure**
- **Electrostatic Precipitator**
- **X-Ray Supply**
- **T48 in Oil or SF6**
- **MV Supply Resistive Measure**
- **E-beam Welder**
- **T43/44 Precision Ultra-High Voltage**
- **Defibrillator**
- **ESD Protection**
- **Air Ioniser**
- **Photomultiplier**

**Applications:***
- Radiation, Gas & Seismic Detection
- X-Ray Supply
- MV Supply Resistive Measure
- E-beam Welder
- T48 in Oil or SF6
- Defibrillator
- ESD Protection
- Air Ioniser
- Photomultiplier
